Abstract

Everything in the material world is a material body and spinning torus shaped nonlinear electromagnetic field (NEMF). It comes from the way the material world was created. The article explains the origin of the spinning in opposite direction male and female NEMF and illustrates with nonlinear physics that the spinning in opposite direction nonlinear electromagnetic fields (NEMFs) of males and females induce magnetic fields with opposite polarity. If so, males attract females as two magnets with opposite polarity would do or in other words the attraction between the sexes is magnetic in origin. The observed dynamics of cell fertilization shows that as soon as the father's male DNA and its spinning NEMF enters the mother's female cell, it is attracted to the female DNA with NEMF spinning in opposite direction, as two magnets with opposite polarity would be. They approach each other, spin around each other and then merge together. This means that not only is the attraction between the sexes magnetic, the conception of each embryo is magnetic in origin.

Keywords: Attraction males-females; Magnetic attraction males-females; Magnetic attraction between the sexes; Conception; Magnetic origin of conception

Introduction

Let us introduce some concepts of nonlinear physics, which we would need. The flux of running river-water would be linear, if the bottom of the river is smooth. However, if there is a big stone on the bottom of the river, the water needs to flow around the stone and the water flux becomes nonlinear. Behind the stone, turbulence would be observed manifested with a couple of: vortex spinning clockwise and anti-vortex spinning counterclockwise. Following the law of the folded fingers of the right hand in physics, when the folded fingers show the direction of the currents (or direction of spinning), the vertical thumb show the direction of the induced magnetic field. Following this law, the vortices (which spin clockwise) would induce magnetic field toward the surface. This would make the vortices to suck energy in. Following the same law, the anti-vortices (which spin counterclockwise) would induce magnetic field off the surface, which would make the anti-vortices to emit energy.

The Attraction Between Males and Females is Magnetic in Origin

The human nonlinear electromagnetic field (NEMF) has a torus shape. As explained in [1], the androgynous fields of the stars (Figure 1) and planets (Figure 2) have two chains of alternating

vortices and anti-vortices running along the equator. Comparing the NEMF of stars and planets with the NEMF of male and female humans (Figure 3), one can see that the androgynous NEMF has been split through the equator to form male NEMF (Yang) from the southern hemisphere (Yang) and female NEMF (Yin) from the northern hemisphere (Yin) [2]. Since the androgynous torus shaped NEMF is a self-organized system, after the split it forms two torus-shape NEMFs - male and female torus-shape NEMFs. As revealed in [2], after the split the male and female have only one chain of alternating vortices and anti-vortices. This chain is along the axis of spinning of the donut shape NEMF, which is along the backbone (Figure 3). Since the androgynous NEMF of stars and planets is vortex on top of anti-vortex [3], which spin in opposite direction, the male and female NEMFs spin in opposite directions. If so, they will induce magnetic fields with opposite magnetic polarity, and they will attract each other as two magnets with opposite polarity do. Therefore, the attraction between the sexes has magnetic origin. Not only are the NEMFs of males and females spinning in opposite directions, their turbulence-their chains of alternating vortices and anti-vortices spin in opposite direction. They are called 'chakras', which in Sanskrit means 'spinning wheels'. The chakras in males and females spin in

opposite direction at the same time of day or night. They change their directions of spinning at dawn and dusk, but always remain opposite in males and females [4]. Since the chakras change their direction of spinning at dawn and dusk, this is the time to meditate or pray and to try to balance the out-of-balance chakras, which

rule the endocrinal glands. According to Russian EEG studies [5], both meditation and prayer, put the Conscious to sleep. Only alpha rhythm was measured during prayer or meditation, just as during sleep. This means that prayer and meditation put the Conscious to sleep, so that the Subconscious can be accessed and reveal itself.

Figure 1: The torus shaped nonlinear electromagnetic field (NEMF) of the Sun..

Figure 2: The torus shaped nonlinear electromagnetic field (NEMF) of the Earth.

Figure 3: Vertical cross-section of the torus shaped nonlinear electromagnetic field (NEMF) of a Man. Numbered are the alternating vortices and anti-vortices of NEMF along the backbone and their corresponding energy levels.

Since hypnotists use hypnosis to put the Conscious to sleep to access the Subconscious [6], obviously meditation and prayer are a-kind-of self-hypnosis. Just like hypnosis, they quiet the Conscious to allow access to the Subconscious, where our Quantum Computer is, which operates with the waves of our NEMF (called Spirit). From the Subconscious, this Quantum Computer through the waves of the Spirit: 1/ rules and regulates all the organs and everything else in the body [7], 2/ scans the environment and send signals to the material body to change to adapt the changed environment [8], and 3/ scans the environment and send signals for fast respond, if fast respond is needed for survival [9].

The Conception-The Merging of The Parents' DNAs in A Fertilized Cell is Magnetic in Origin

In the issue of Physics Today of September 2019, Daniel Needleman and Michael Shelly reveal the complexity of the fluid dynamics of living cells. On page 35, they illustrated the monitored with fluorescent microscopy fluid dynamics of a cell after fertilization - the two clumps of parents' DNAs merge toward each other, spin around each other before to fuse (like dancing), and then fuse together [10] (Figure 4). The observed dynamics of merging of the mother's and father's DNAs reminded me the observed-with-LEGO merging of two Black Holes. The NEMFs of the mother's and father's DNAs also spin around each other (dance) before to fuse together (Figure 4) just like two Black Holes do before to merge. At the merging of two Black Holes waves are emitted. I am more than sure that such waves are emitted when the mother's and father's DNAs merge in a fertilized cell. The scientists just need to find a way to register them. In the micro world, when the spinning in opposite direction electron and positron merge, the same spinning around each other takes place, after which they fuse together (annihilate) and a gamma quant is emitted. Since at the merging of two Black Holes, which spin around each other before to merge, waves are emitted, I am

more than sure that such waves are emitted when electron and positron merge. The scientists just need to find a way to register them. After such waves are registered at the merging of the mother's and father's DNAs in a fertilized cell and at the merging of electron and positron, hopefully we will stop calling the waves emitted at merging of two Black Holes gravitational waves and start calling them electromagnetic waves because as I will explain farther they are electromagnetic waves. Let us see what is the basis of this dancing around each other before to fuse together? Let start with the simplest-the merging of electron and positron. When an electron is knocked out of the space matrix, it spins counterclockwise because only counterclockwise anti-vortices induce outward magnetic field and create matter. The remaining hole in the space matrix, called positron, spins clockwise like a vortex and the induced by the spinning magnetic field is inward. For this reason, the remaining hole will keep trying to suck back the knocked-out electron. The spinning in opposite directions electron and positron will have opposite magnetic polarity and would attract each other as two magnets with opposite polarity do. Obviously, when two spinning in opposite direction entities meet, they spin around each other (they dance) before to merge together. This is true when the entities spinning in opposite directions are electron and positron and this is true when the spinning in opposite directions entities are the NEMFs of the mother's and father's DNAs in a fertilized cell. The spinning in opposite directions NEMFs of mother's and father's DNA in a fertilized cell will have opposite magnetic polarities and they will attract each other as two magnets with opposite polarity do. Thus, the procreation following cell fertilization is based on magnetic attraction between the spinning in opposite direction NEMF of the father's and mother's DNA, which makes them attract each other, spin around each other, and then merge in the middle of the fertilized cell making it ready for division (Figure 4) .

Figure 4 A : In the fertilized cell, the two clumps of spinning in opposite direction mother's and father's DNAs (dark circles) migrate, meet, spin around each other, and fuse at the center of the cell.

Conclusion

The article used nonlinear physics to illustrate that the spinning in opposite direction NEMFs of males and females induce magnetic fields with opposite polarity, which makes the attraction between males and females magnetic in origin. The magnetic origin of the male to female attraction can also be seen in the dynamics of cell fertilization [10]. As soon as the NEMF of the DNA of the male sperm enters the female cell, it is attracted to the NEMF of the female cell, which spin in opposite direction. If the male NEMF spins clockwise as a vortex, it will suck energy in (because this is what vortices do) and it will start spinning faster. The faster spinning will induce stronger magnetic field and it will attract stronger the NEMF of the female cell spinning in opposite direction.

The two NEMF will merge closer, spin around each other before to fuse and then fuse together. Thus, the fact that the whole material world is a material body and NEMFs of "the mother's and father's DNAs" [2] manifest itself in this common dynamic behavior:

- In the micro world when the spinning in opposite directions NEMFs of electron and positron merge, they spin around each other before to fuse and then fuse together
- when the spinning in opposite directions NEMFs of the parents' female and male DNAs merge, they spin around each other before to fuse and then fuse together
- when the spinning in opposite directions NEMFs of two Black Holes merge, they spin around each other before to fuse and then fuse together.

Thus, the dynamic of cell fertilization is another illustration that the mother's and father's DNAs spin in opposite direction and induce magnetic fields with opposite polarity, which makes them attract each other as two magnets with opposite polarity would do. This makes the conception of each embryo to be magnetic in origin, just as the attraction between males and females has magnetic origin.
