Research

Researchers from Johns Hopkins Hospital have published information which reports:

a. 40%-80% of chronic pain patients are misdiagnosed [1-5]. Most are told they have sprains and strains when they actually have surgically correctable lesions [1,2,5]. For CRPS (RSD) 71%-80% of patients really have nerve entrapment, which responded to peripheral nerve decompression [3,4].

b. Doctors order the wrong tests and don't spend enough time taking a careful history. A Wall Street Journal article quotes medical research which says the two leading causes of misdiagnosis are

i. Ordering the wrong diagnostic test (57%) and
ii. Poor history taking (56%) [6].

c. MRIs miss damaged discs 76%-78% of the time, and CTs miss bony lesions detected by 3D-CT 56% of the time [7,8].

d. Once a thorough history is taken, and the proper tests are ordered, 50%-63% of patients, previously told there is nothing to be done to help them, require surgery to improve [1,2,5].

Don Long, MD, PhD, former chairman of neurosurgery at Johns Hopkins Hospital reported about a group of 70 patients with neck pain and headache, who, after having normal MRI, CT and X-rays, had been told that nothing could be done to help their pain. These patients then received facet blocks, root blocks, provocative disco grams, and peripheral nerve blocks to improve the accuracy of diagnosis. These are interventional procedures, which require the use of a C-arm fluoroscope, and can be performed by an anesthesiologist, interventional radiologist, or a surgeon.

The tests are available at www.MarylandClinicalDiagnostics.com, and can increase income, and improve patient care.

These tests benefit the surgeon in various ways:

a) Produce a more accurate evaluation in less time, with less inter-rater reliability issues.

b) Get paid for the actual tests themselves, using CPT codes which have been used in the past. The average payment is $76 for both tests.

c) See more patients in a day, since using the tests will allow a physician to evaluate a patient in 5 minutes instead of the normal 20-40 minutes.

d) The Treatment Algorithm will recommend that a physician perform facet blocks, root blocks, peripheral nerve blocks, and provocative disco grams at a far higher level than they do now.
e) The number of patients who will require surgery will increase 50%-63%.

Orthopedic and neurosurgeons using the tests report an increase in income of at least 20% a year without increasing the time spent seeing patients, and produces better patient satisfaction.

Your next submission with Juniper Publishers will reach you the below assets

- Quality Editorial service
- Swift Peer Review
- Reprints availability
- E-prints Service
- Manuscript Podcast for convenient understanding
- Global attainment for your research
- Manuscript accessibility in different formats (Pdf, E-pub, Full Text, Audio)
- Unceasing customer service
